### ~~Abstract~~

~~--A camera system has an image sensor for sensing an image, a processor for processing the sensed image, a print media supply unit for the supply of print media to a print head and a print head for printing the sensed image on the print media stored internally to the camera system. A portable power supply is connected to the print head, the sensor and the processing means, and also operates a guillotine mechanism located between the print media supply unit and the print head. The guillotine mechanism is adapted to cut the print media into sheets of a predetermined size, is detachable from the camera system, for example, attached to the print media supply unit, and can be mounted on a platten unit below the print head.--~~
